

Frustrated? We hear you!

Predictive Insights and Analytics

Empower your services team with meaningful data and insight allowing them to capture relevant information, address pain points and resolve issues before your business is impacted.

Technology is intended to make our work faster, more cost effective, efficient, and to enable new business. Is this your experience?

Have you wondered how costly system downtime is in terms of employee productivity? Are you anxious about system failures preventing your business from meeting targets? Is your IT department frustrated, reacting to system issues rather than preventing them?

When assessing user productivity, business projections and project efficiency, IT is often not included yet it should be. Research shows improvement of power, speed and overall capability of IT systems results in increased end user productivity. Not only does IT system failure impact organisational efficiency, it also leaves your end users, IT department and potentially your customers frustrated with the experience resulting in decreased profitability for your company.

How Predictive Insights and Analytics will improve your business performance:

Predictive Insights and Analytics (PIA) is a managed service designed to enable your department to be proactive in solving system issues without increasing staff, skills or responsibilities while also improving productivity and revenue. PIA delivers deep insights into all end user computing infrastructure components. PIA will:

Cut the cost of your IT systems – Stop paying more money for an inefficient environment. PIA automatically monitors your environment in real time, identifying problems before they become issues, meaning your systems will cost less to run.

Reduce your crisis management – Knowing about problems before they become high priority issues means you can address them early and save your business from the typical reactive panic mode.

Reduce wasted resources – Lack of visibility into your end user experience results in higher unplanned costs. PIA provides analytical data we use to provide you recommendations that maximise resource utilisation and reduces the overall infrastructure footprint required to meet your end user expectations.

Be compliant – There's a lot of risk surrounding system compliancy. PIA can give you visibility and reporting on asset management and license consumption.

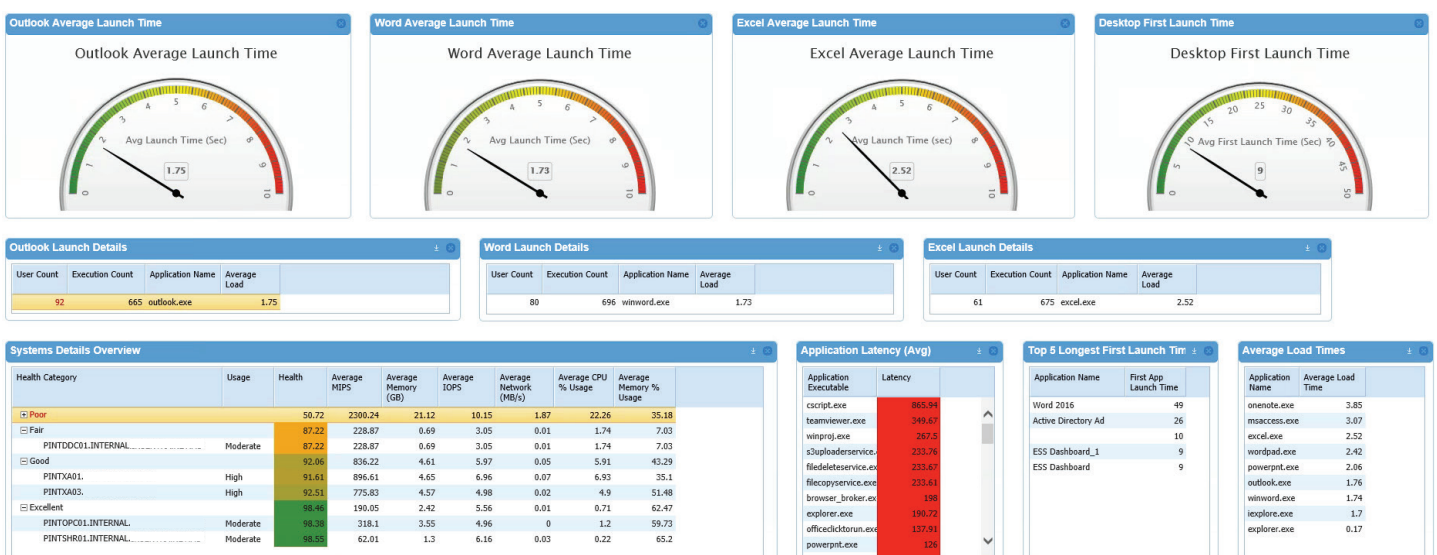

Increase workplace productivity – PIA provides tailored dashboards and reports specific to your role (CIO, IT Manager, Support Analyst etc) meaning you have more time for other things.

Improve budgeting and spending – By understanding trends and having visibility you can plan your expenditure, knowing exactly what you need to purchase and when it is needed. Eliminate the need to buy more than you need “just in case.”

Stay within budgets – Only pay for what you're using. PIA is charged based on a cost effective per user/month basis.

Empower your IT department by getting it right the first time with improved reliability, application performance and enhanced user experience.

PIA delivers deep insights into all end user computing infrastructure components. Insentra are experts in deploying PIA to automatically monitor your environment ensuring you receive all the benefits listed above and more. We provide Enhanced Support Services for Citrix, Microsoft, Symantec, VMware and Veritas services and environments.
